

Fine pose reproduction: position

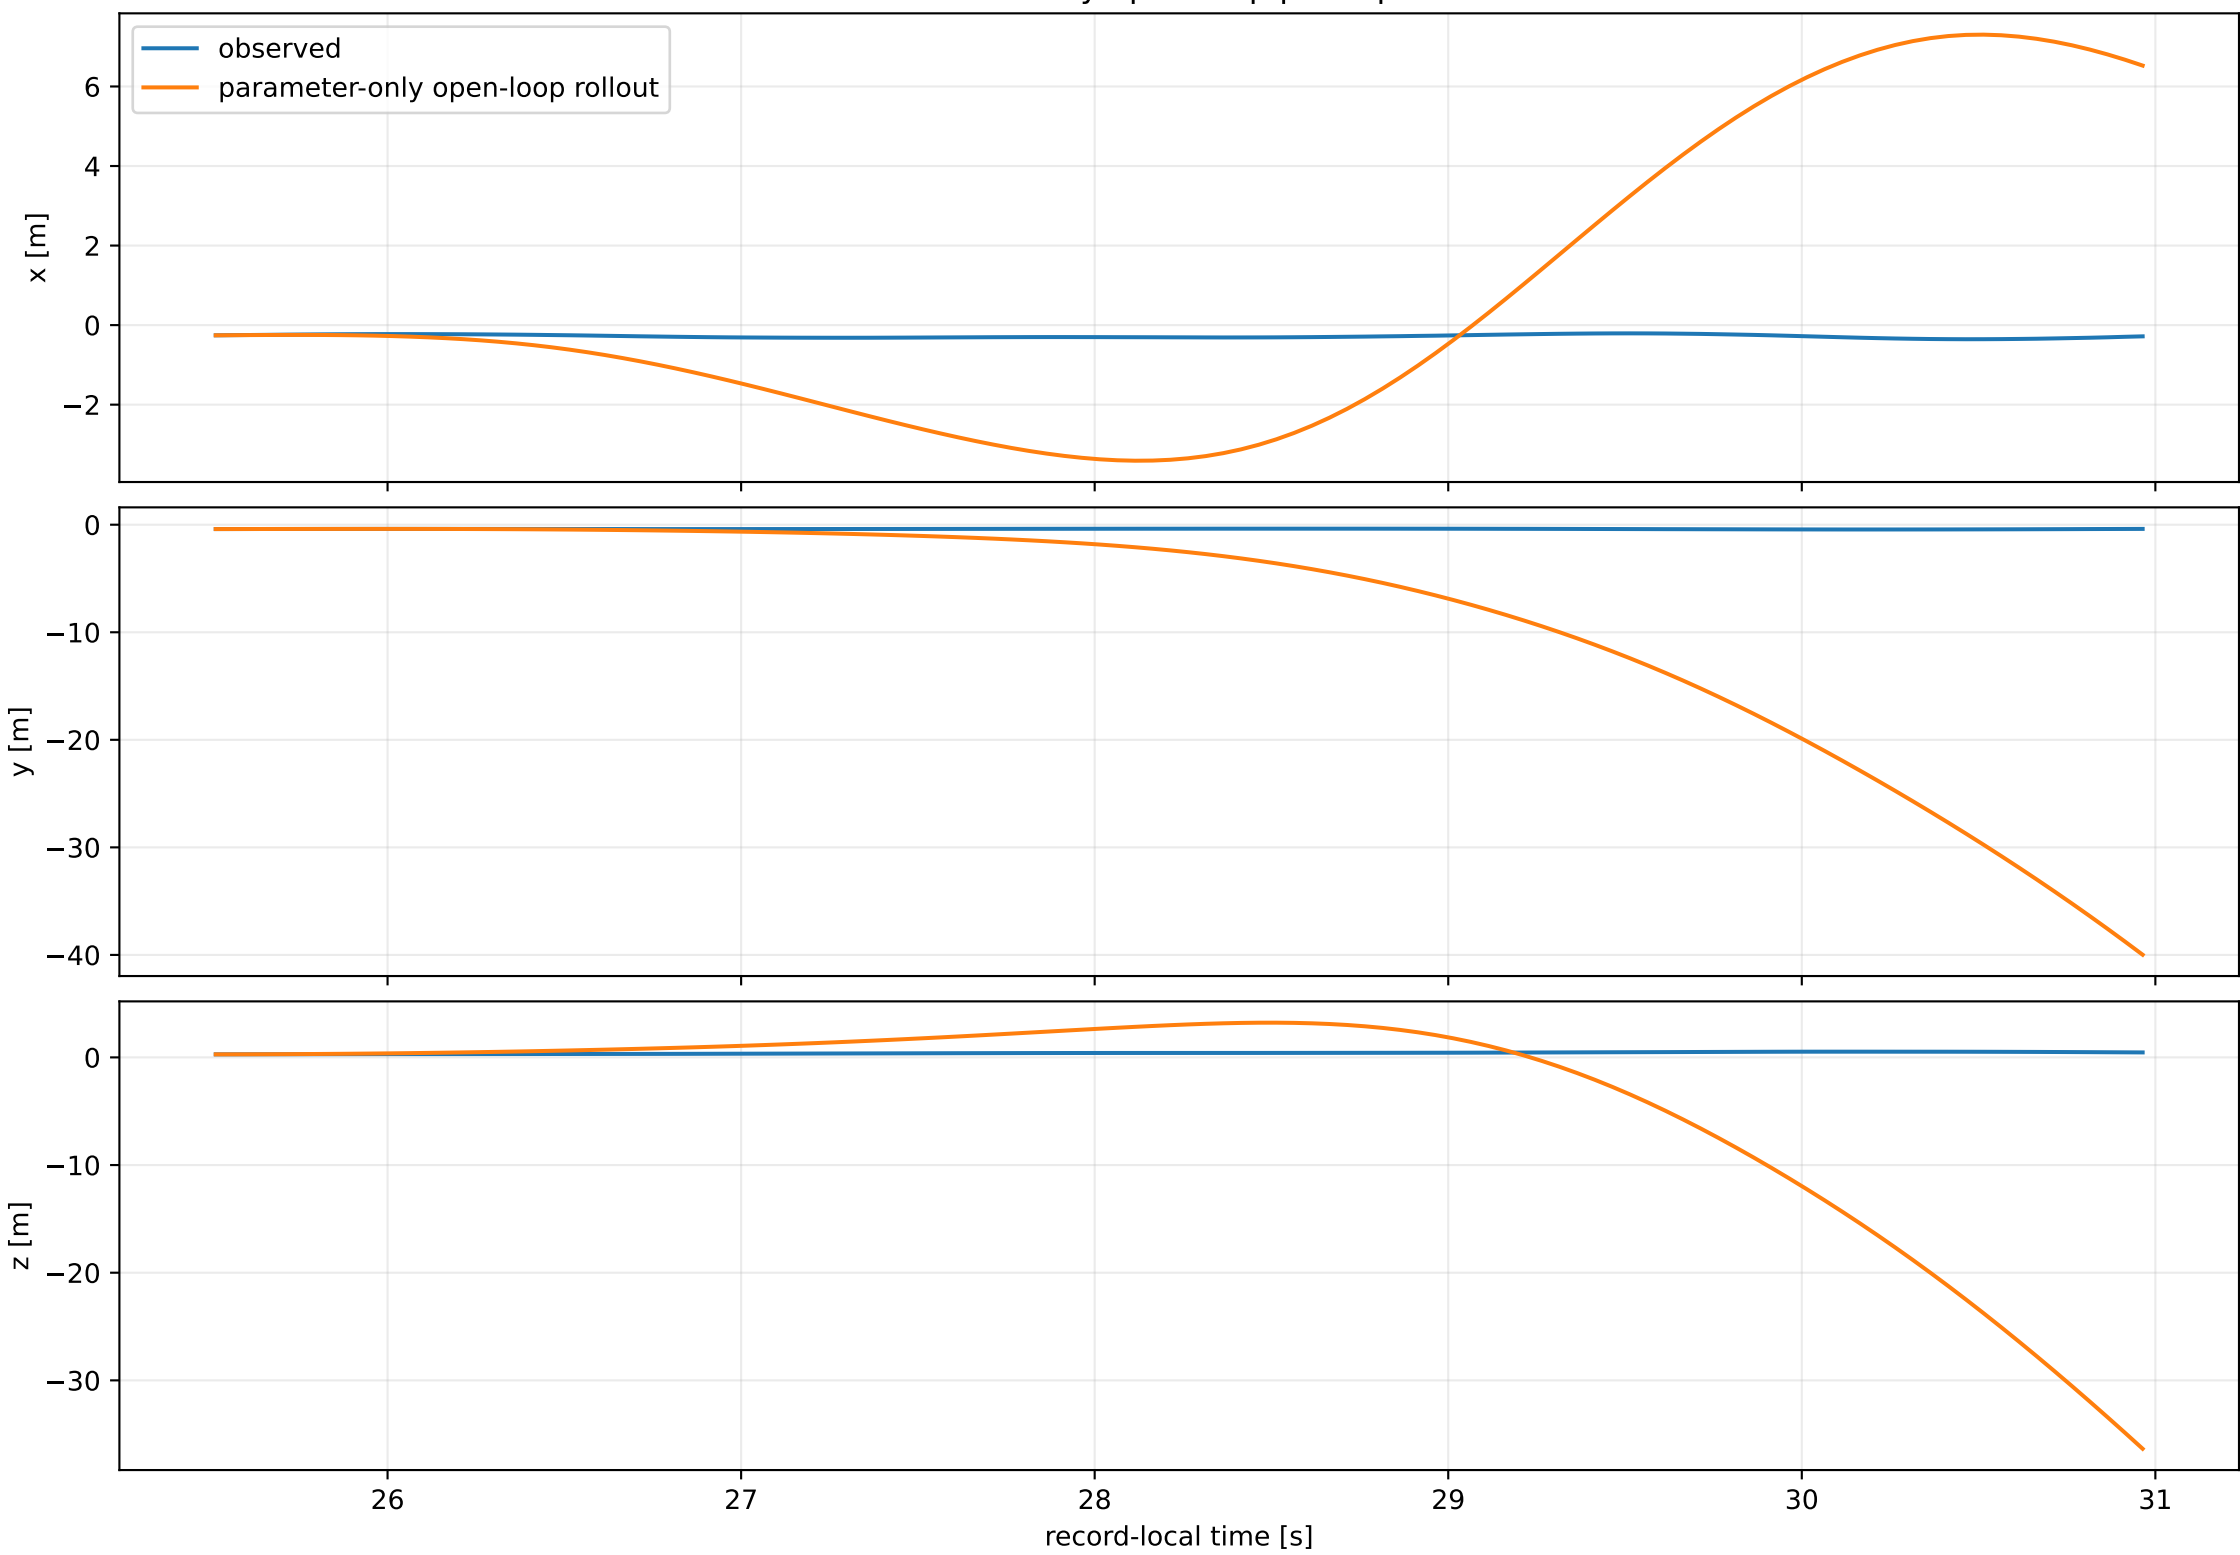

Fine pose reproduction: roll / pitch / yaw

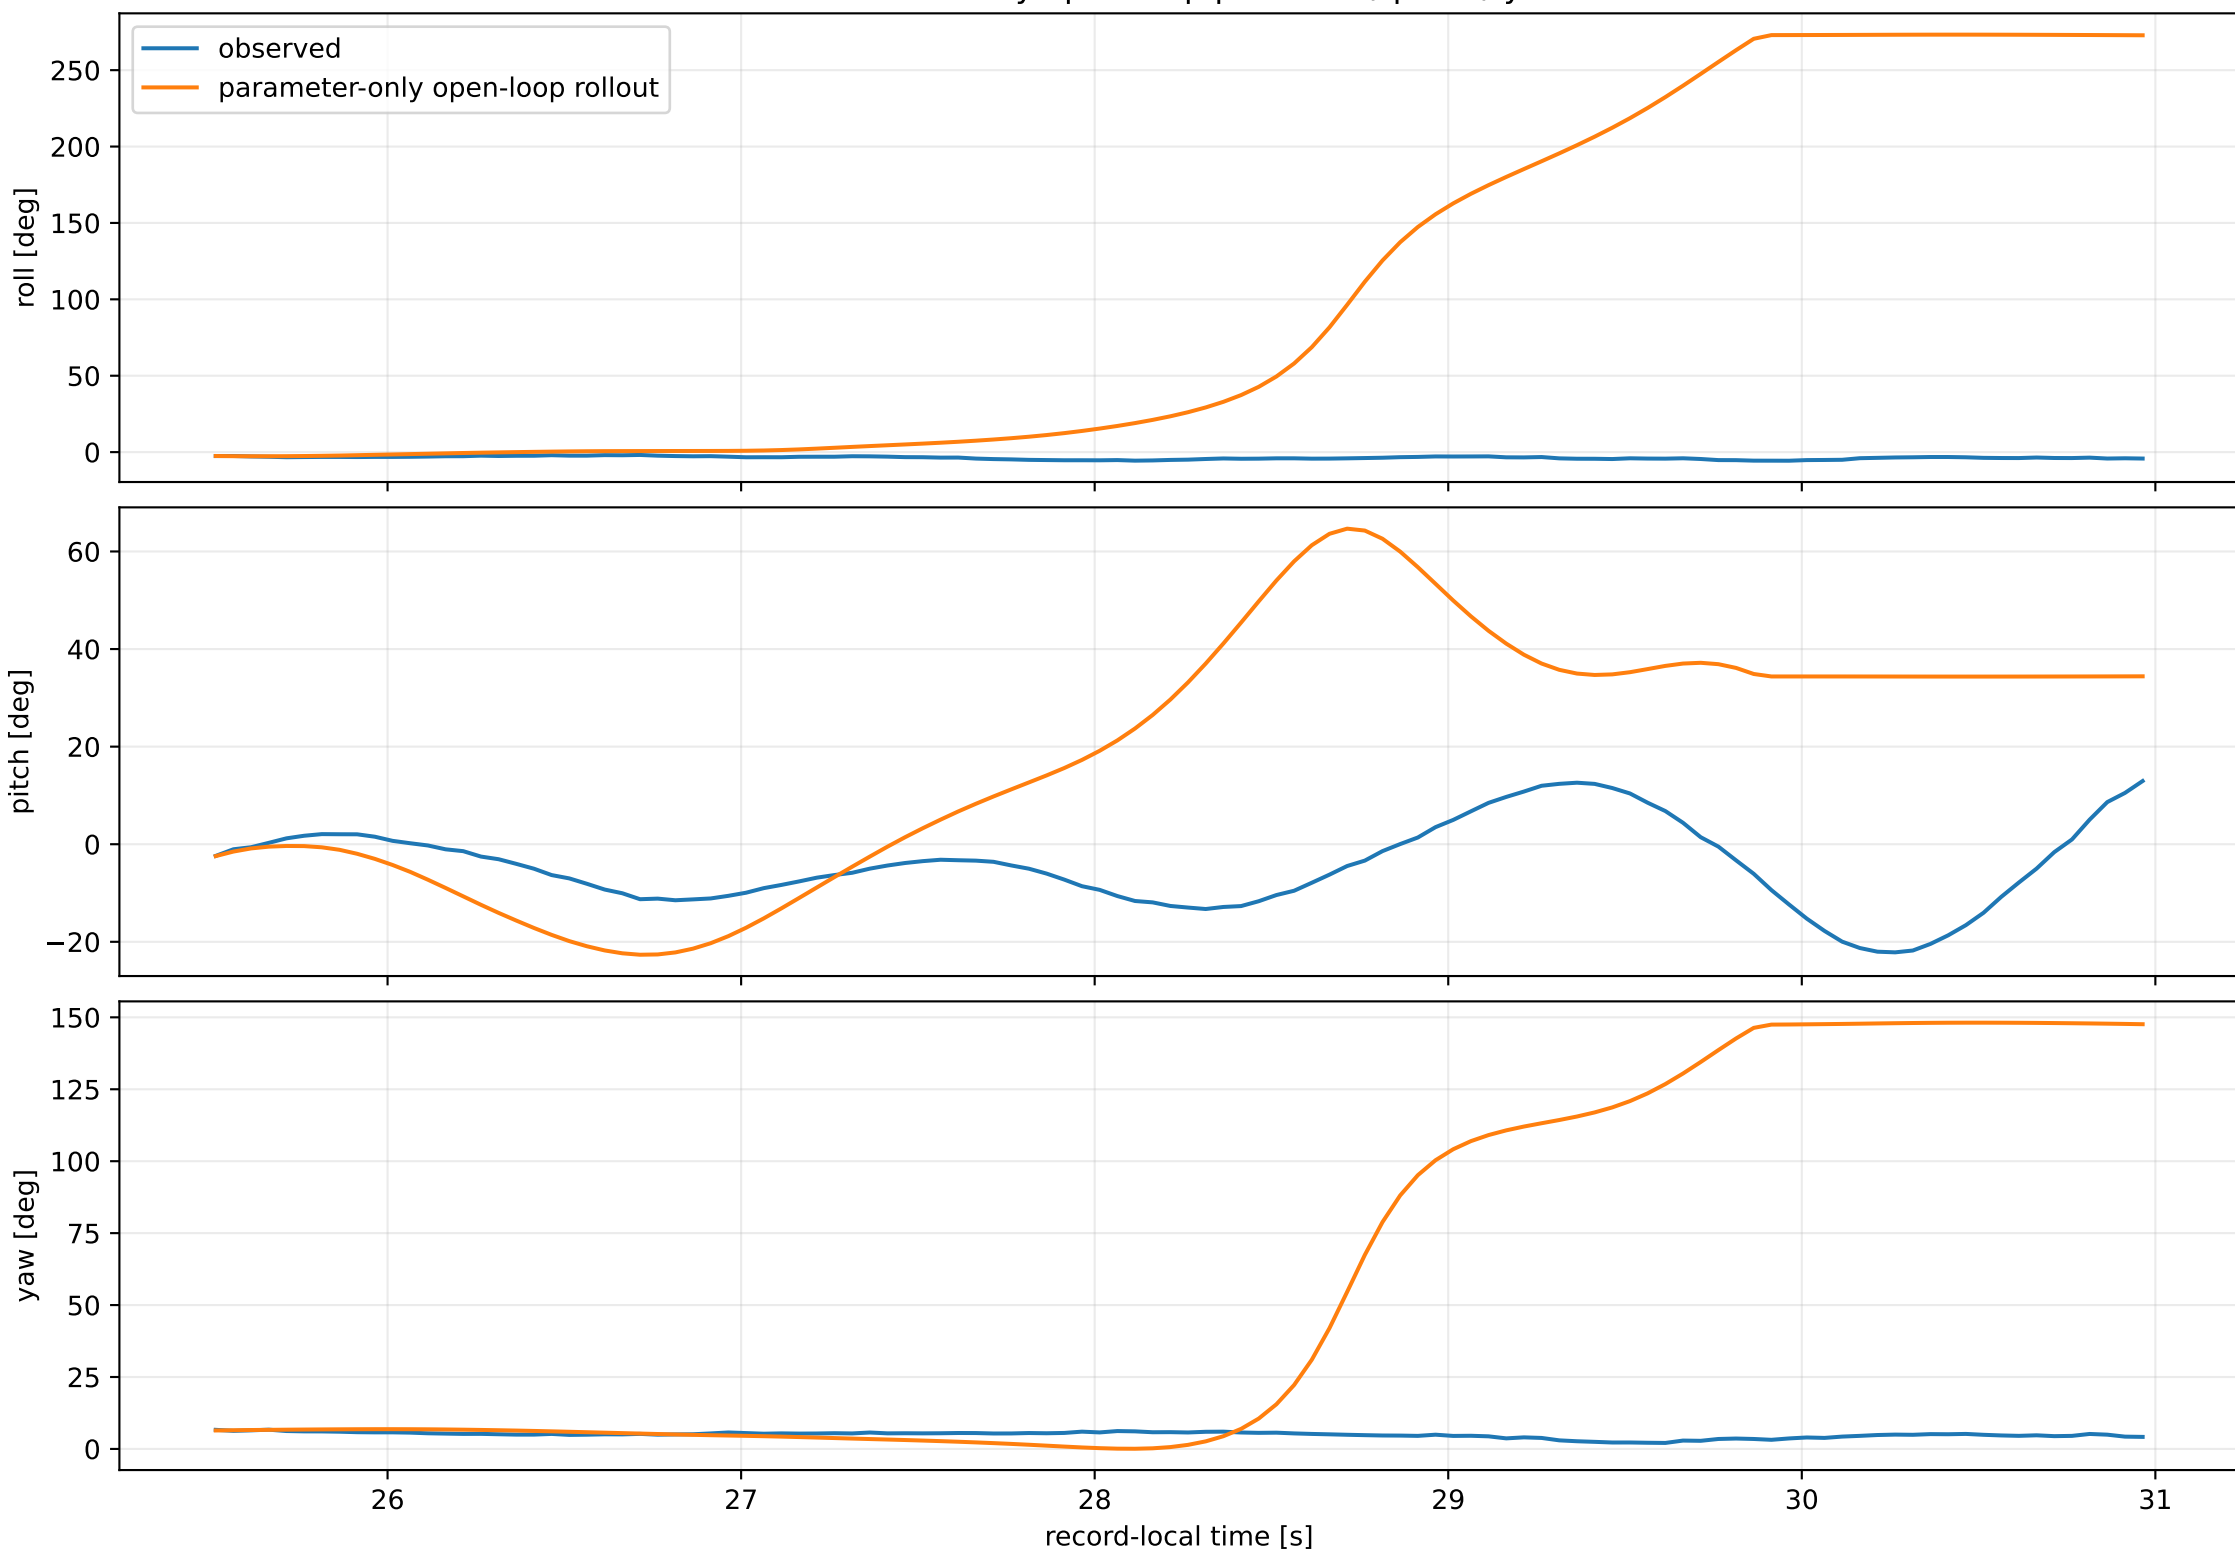

Fine replay error after the 14-D change — lower is better

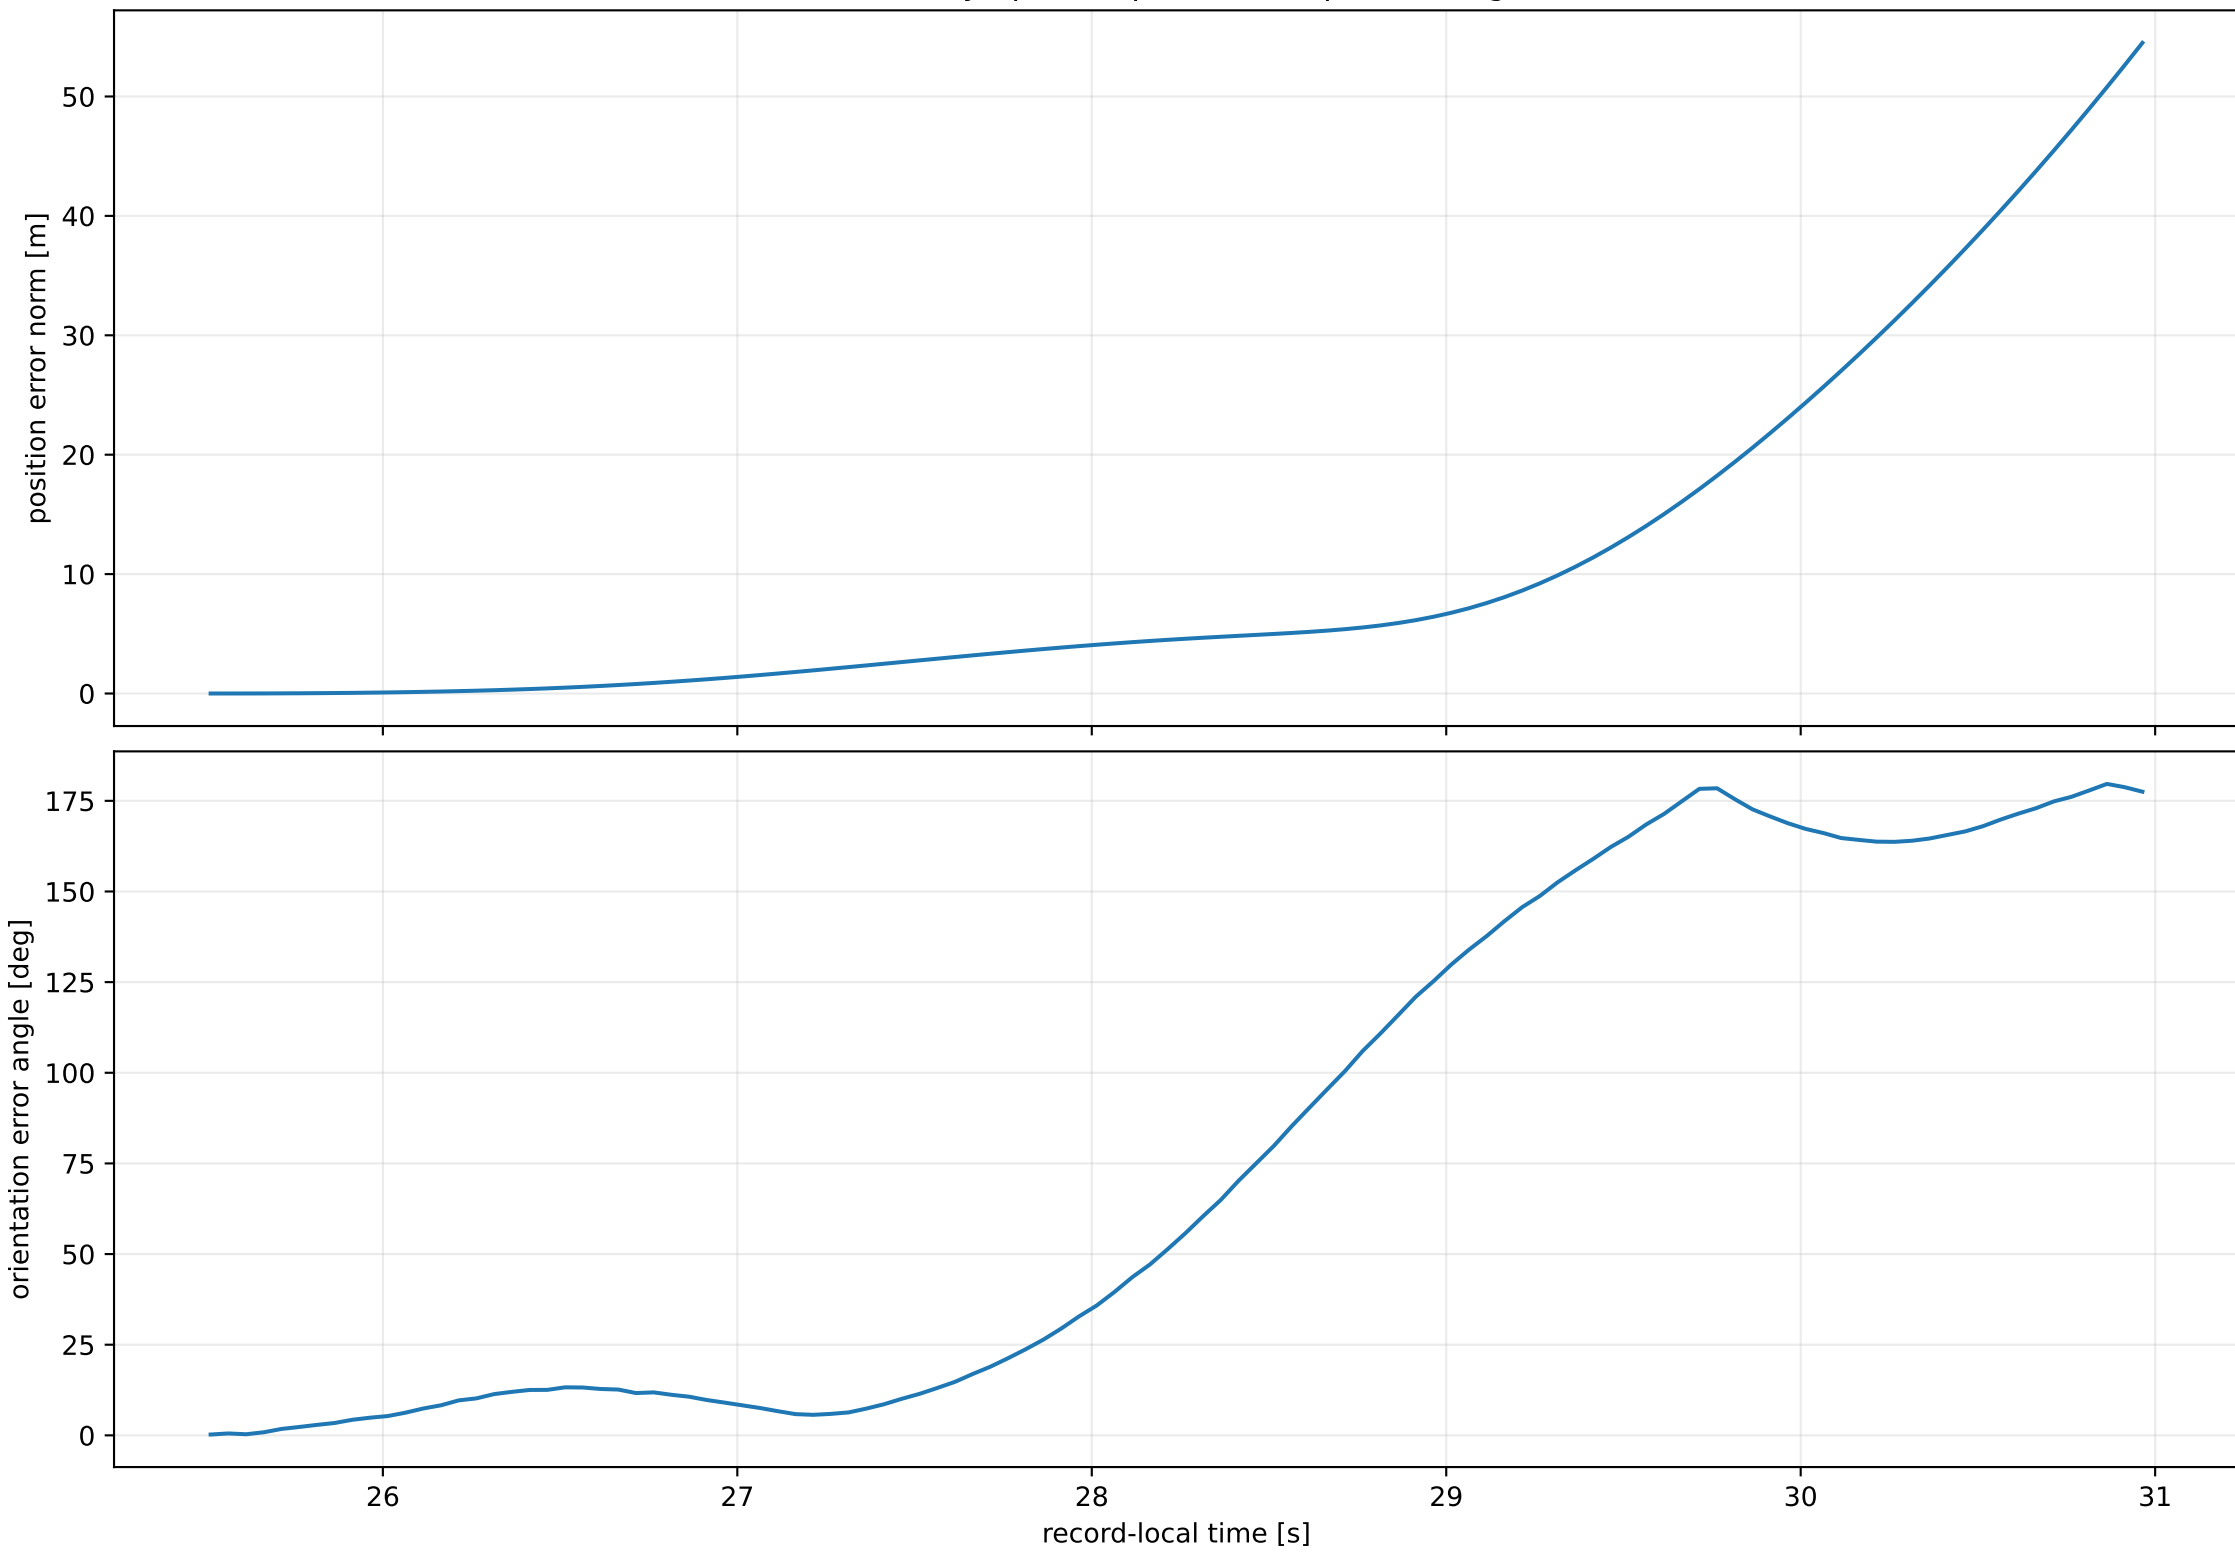

Parameter-only open-loop pose: position

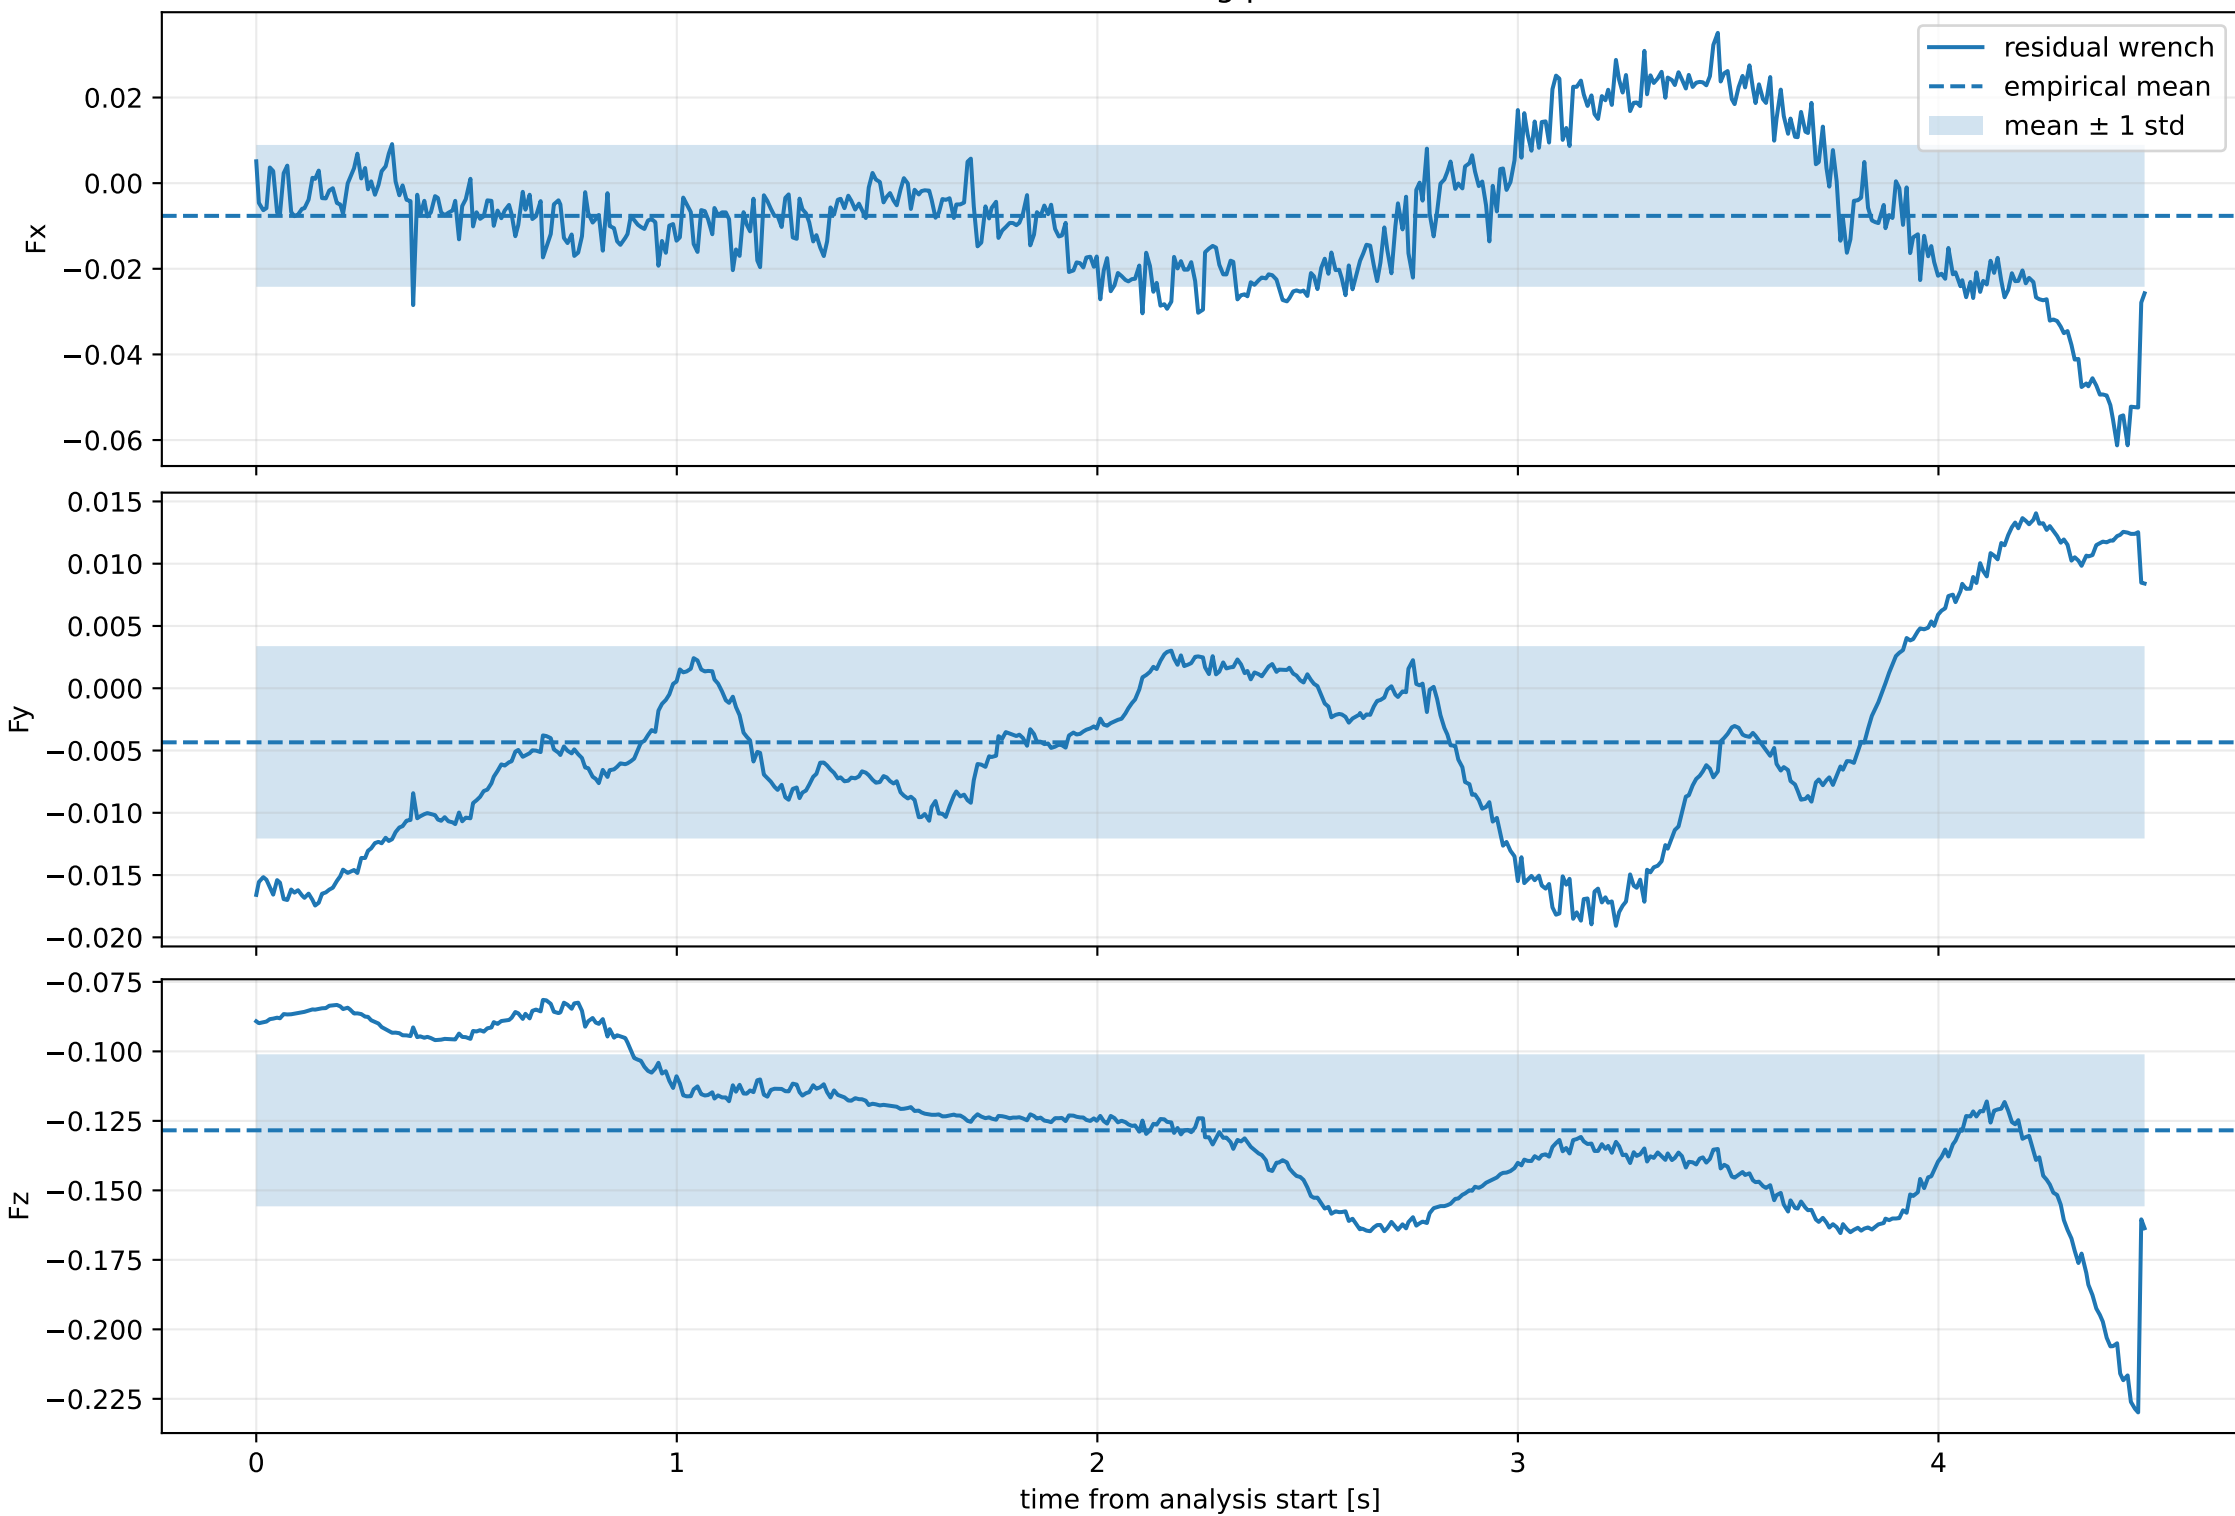

Parameter-only open-loop pose: roll / pitch / yaw

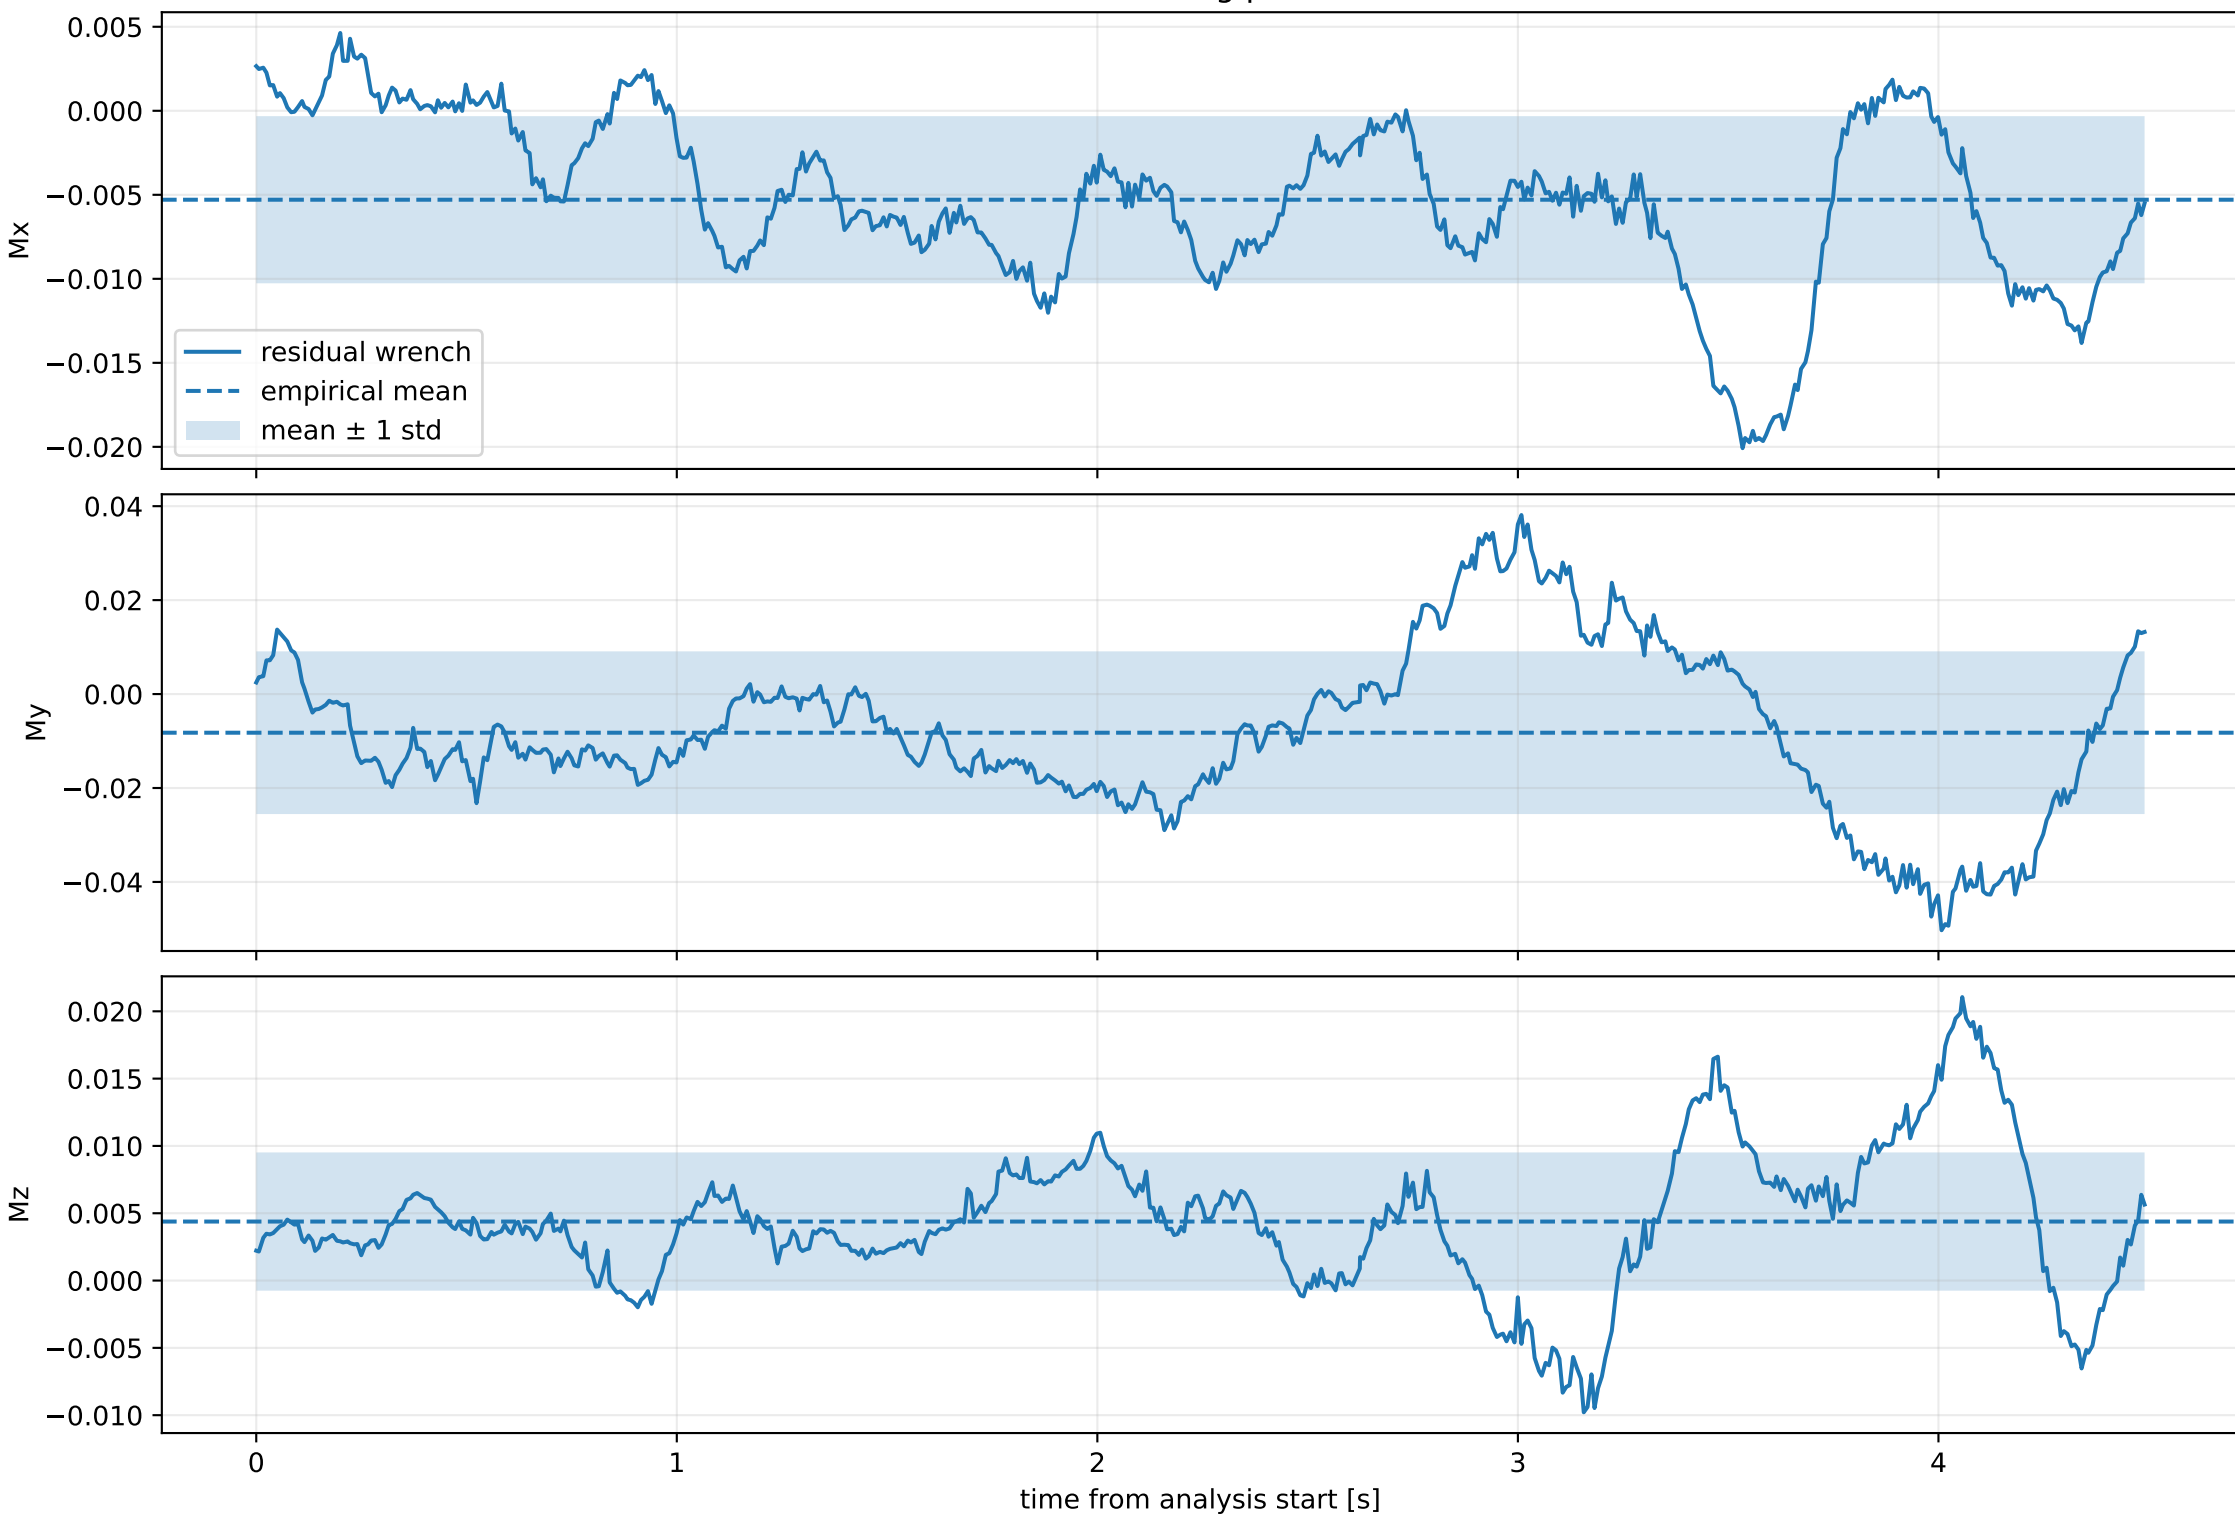

Parameter-only open-loop rollout (separate diagnostic)

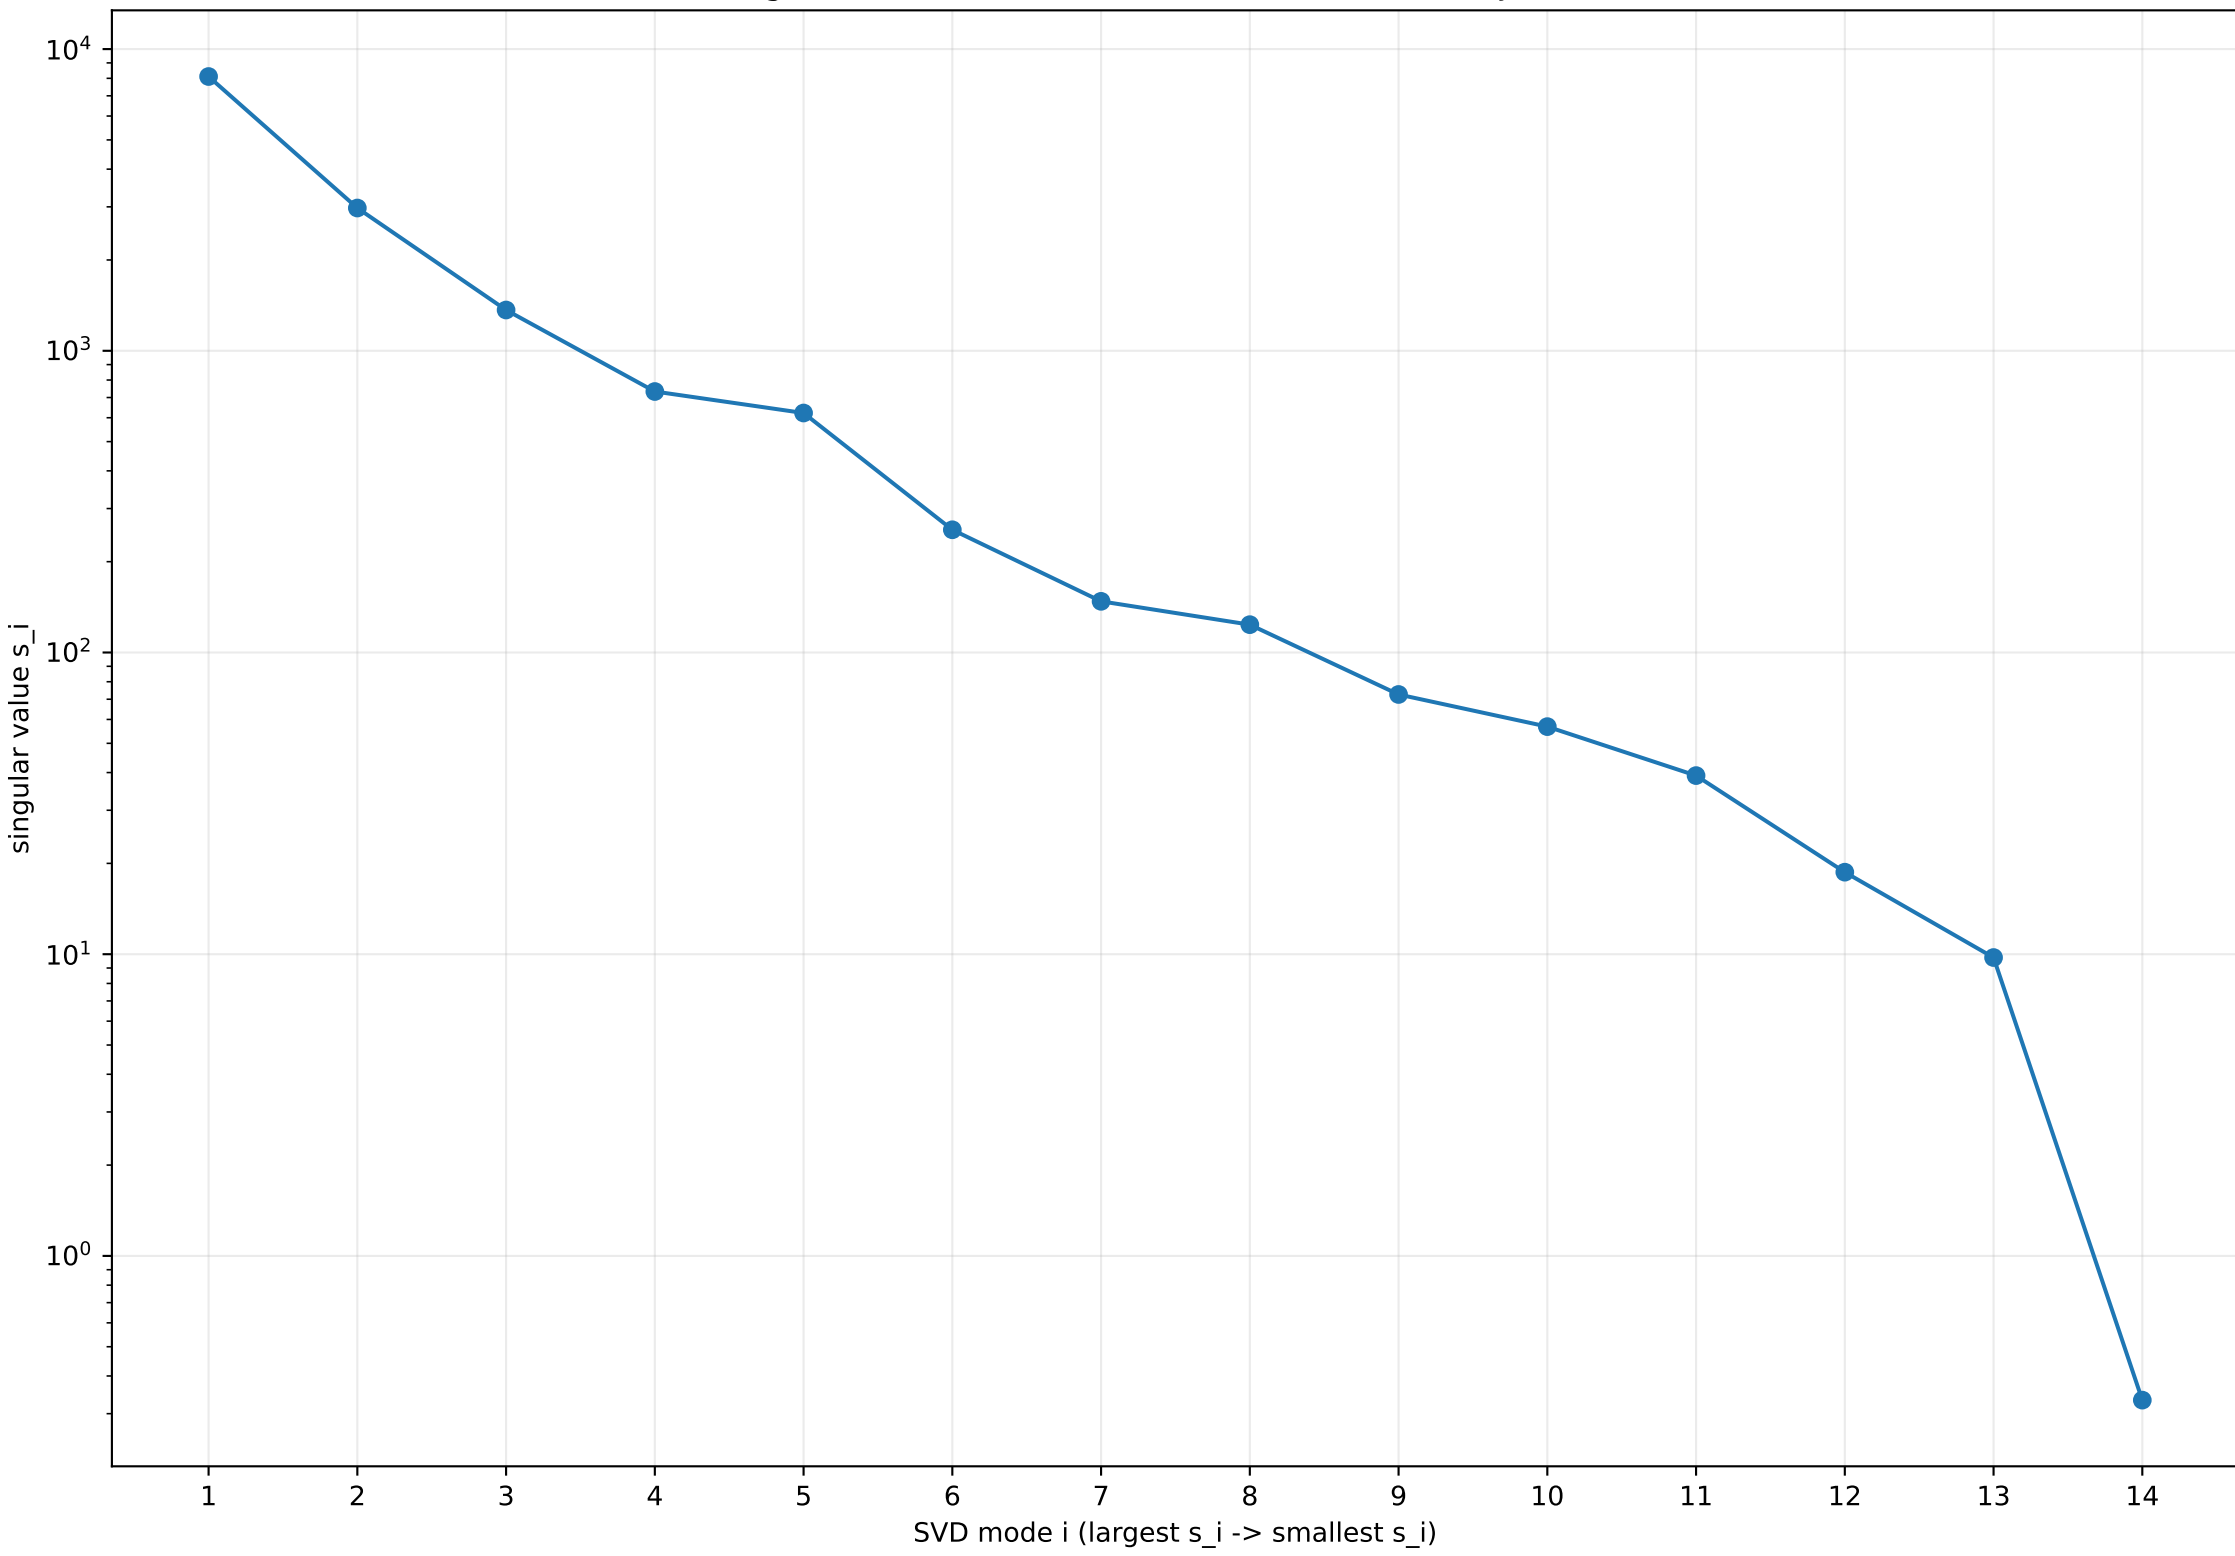

Dimensionless residual force: empirical mean ± 1 std
Wide band = disturbance varies more, so matching parameter directions receive weaker evidence

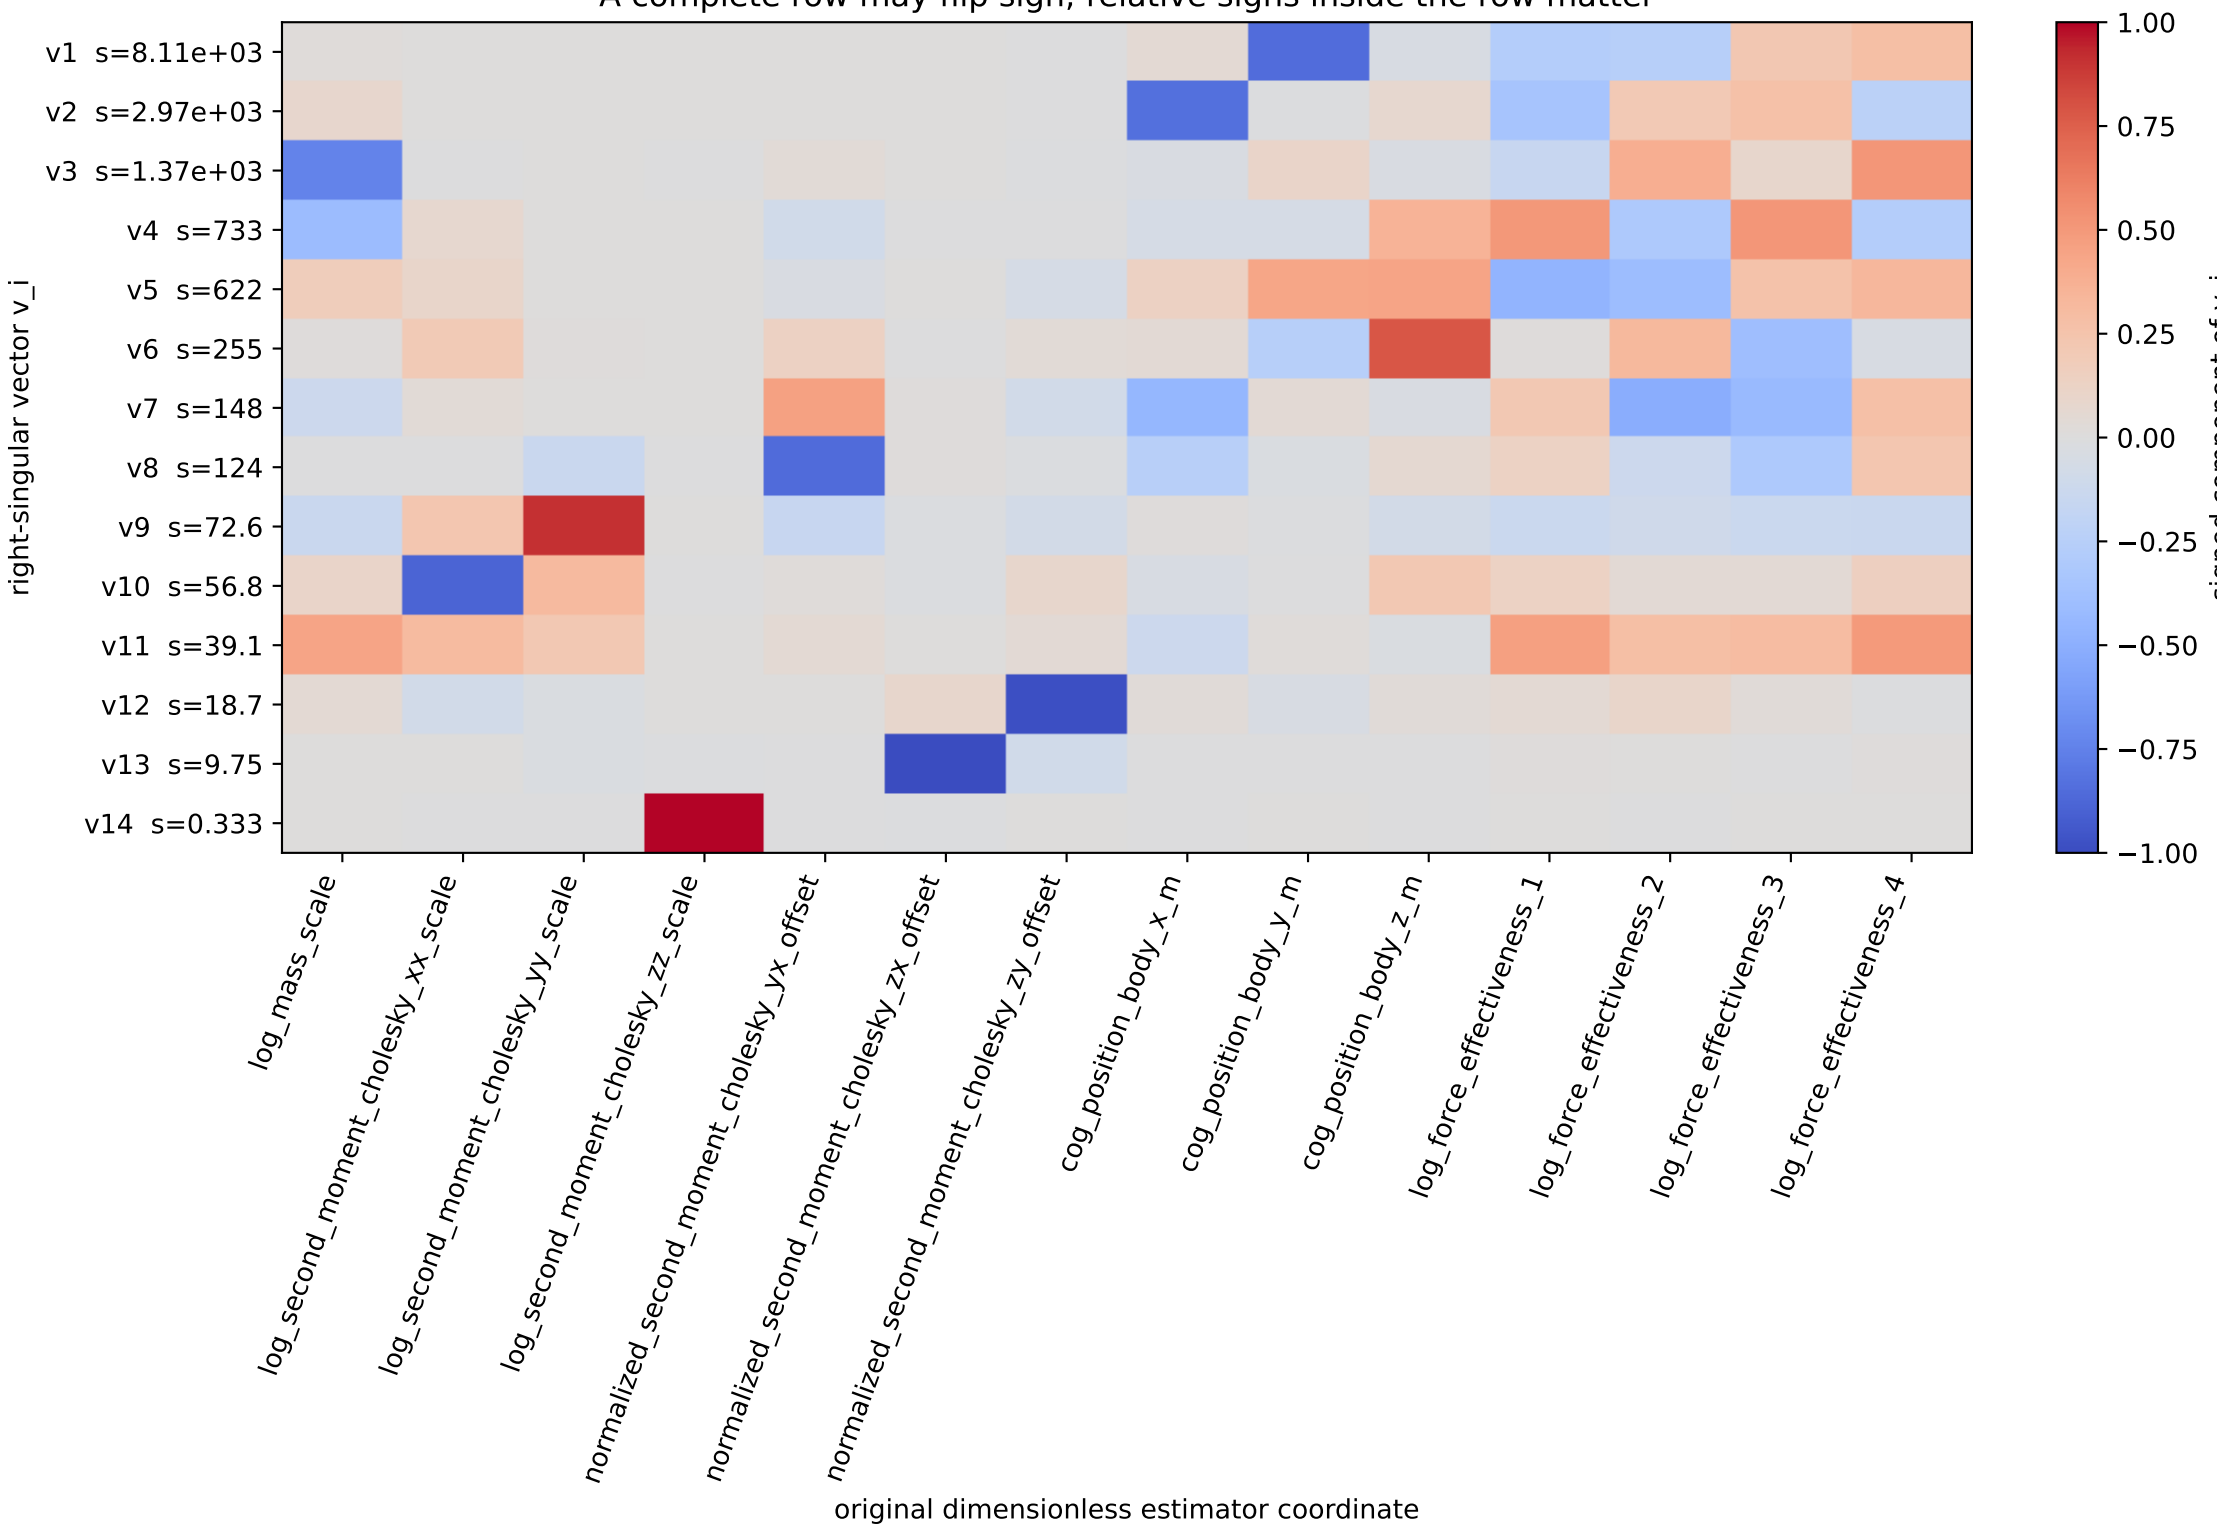

Dimensionless residual torque: empirical mean $\pm$ 1 std
Wide band = disturbance varies more, so matching parameter directions receive weaker evidence

Singular values S of the whitened dimensionless Jacobian

Signed right-singular vectors V^T
A complete row may flip sign; relative signs inside the row matter

Decoded physical parameters at the selected estimate

mass [kg]

2.36629770872

inertia J [kg m²]

[0.06500208 5.1881684e-06 1.7411624e-05]
[5.1881684e-06 0.064981752 -2.8874774e-06]
[1.7411624e-05 -2.8874774e-06 0.12899242]

principal moments [kg m²]

[0.064980503, 0.065003323, 0.12899243]

CoG position in body frame [m]

[-0.0026407696, 0.00037695711, 0.0096914226]

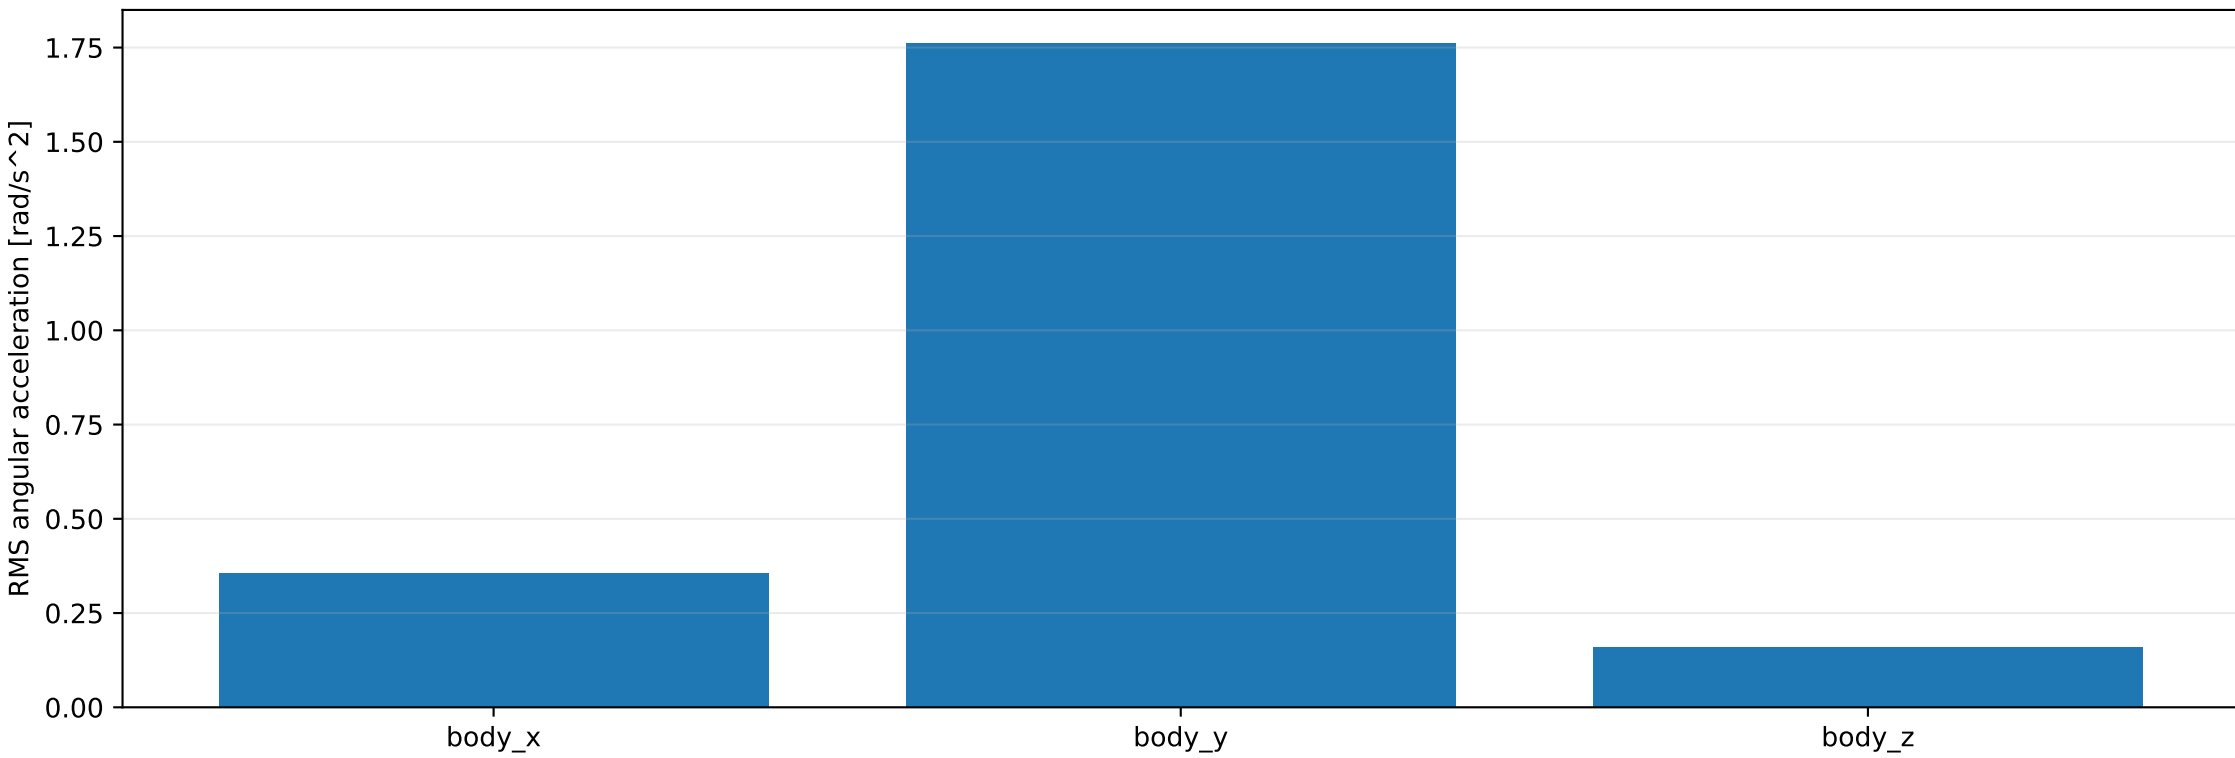

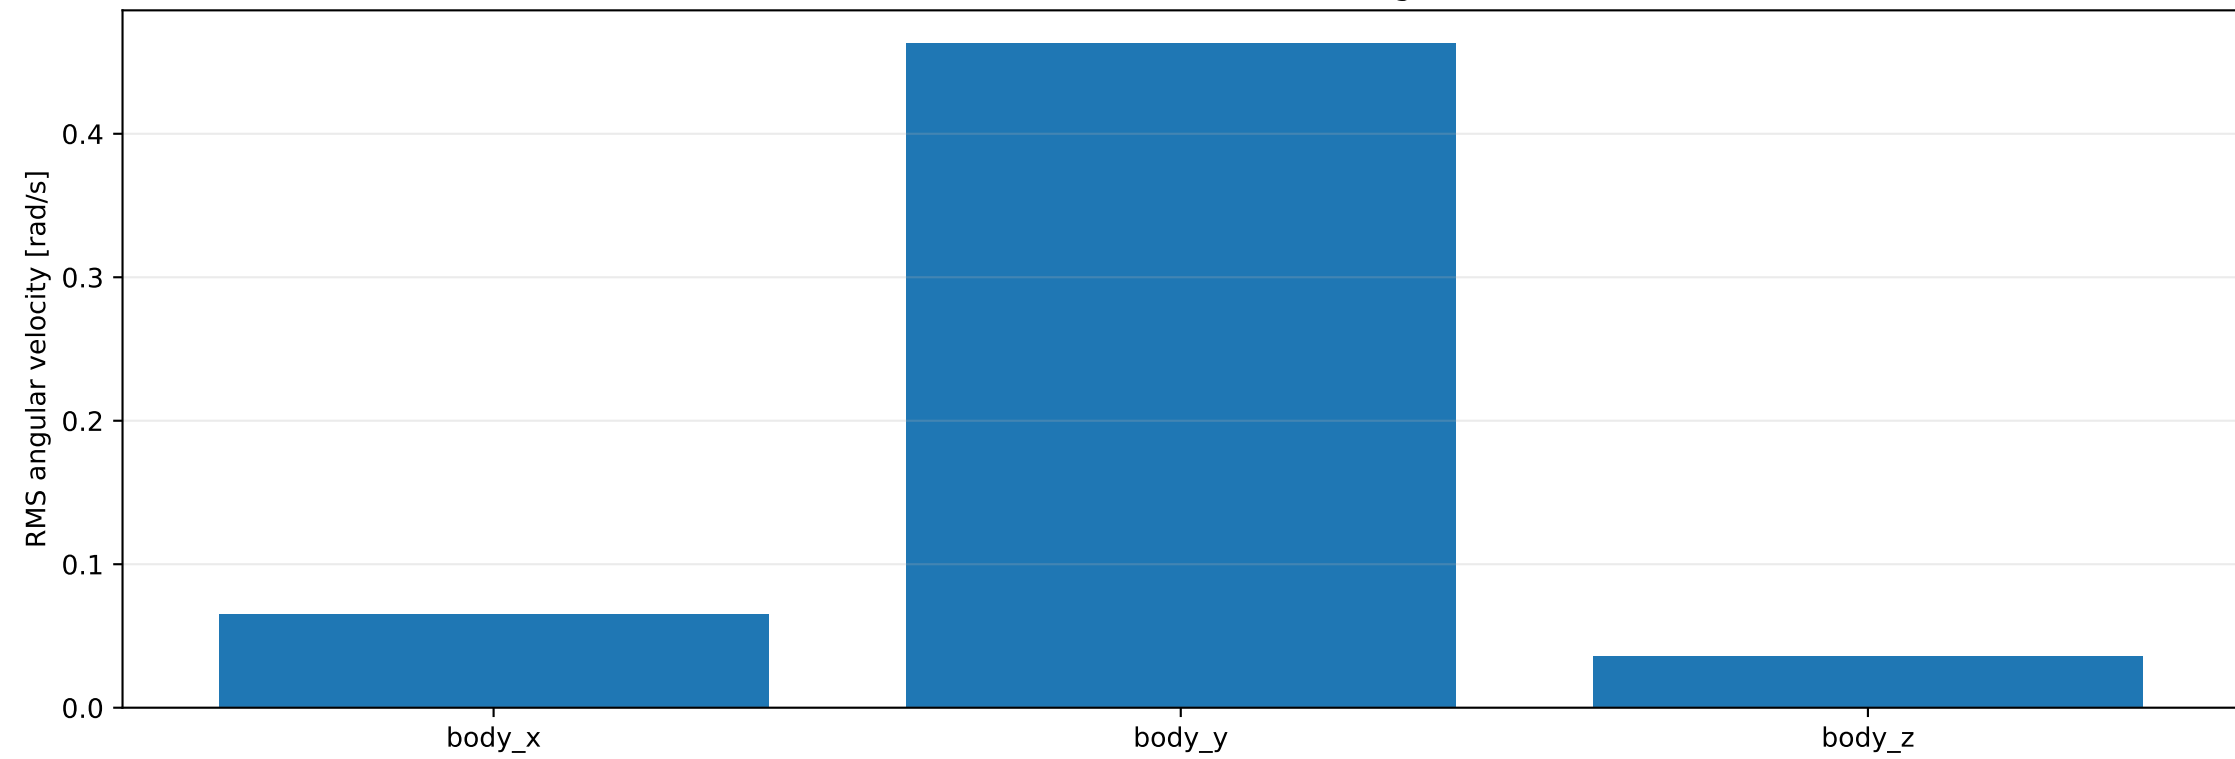

rotor force effectiveness

[0.9617672, 0.97108931, 0.96546824, 0.95631235]

selected delay [s]

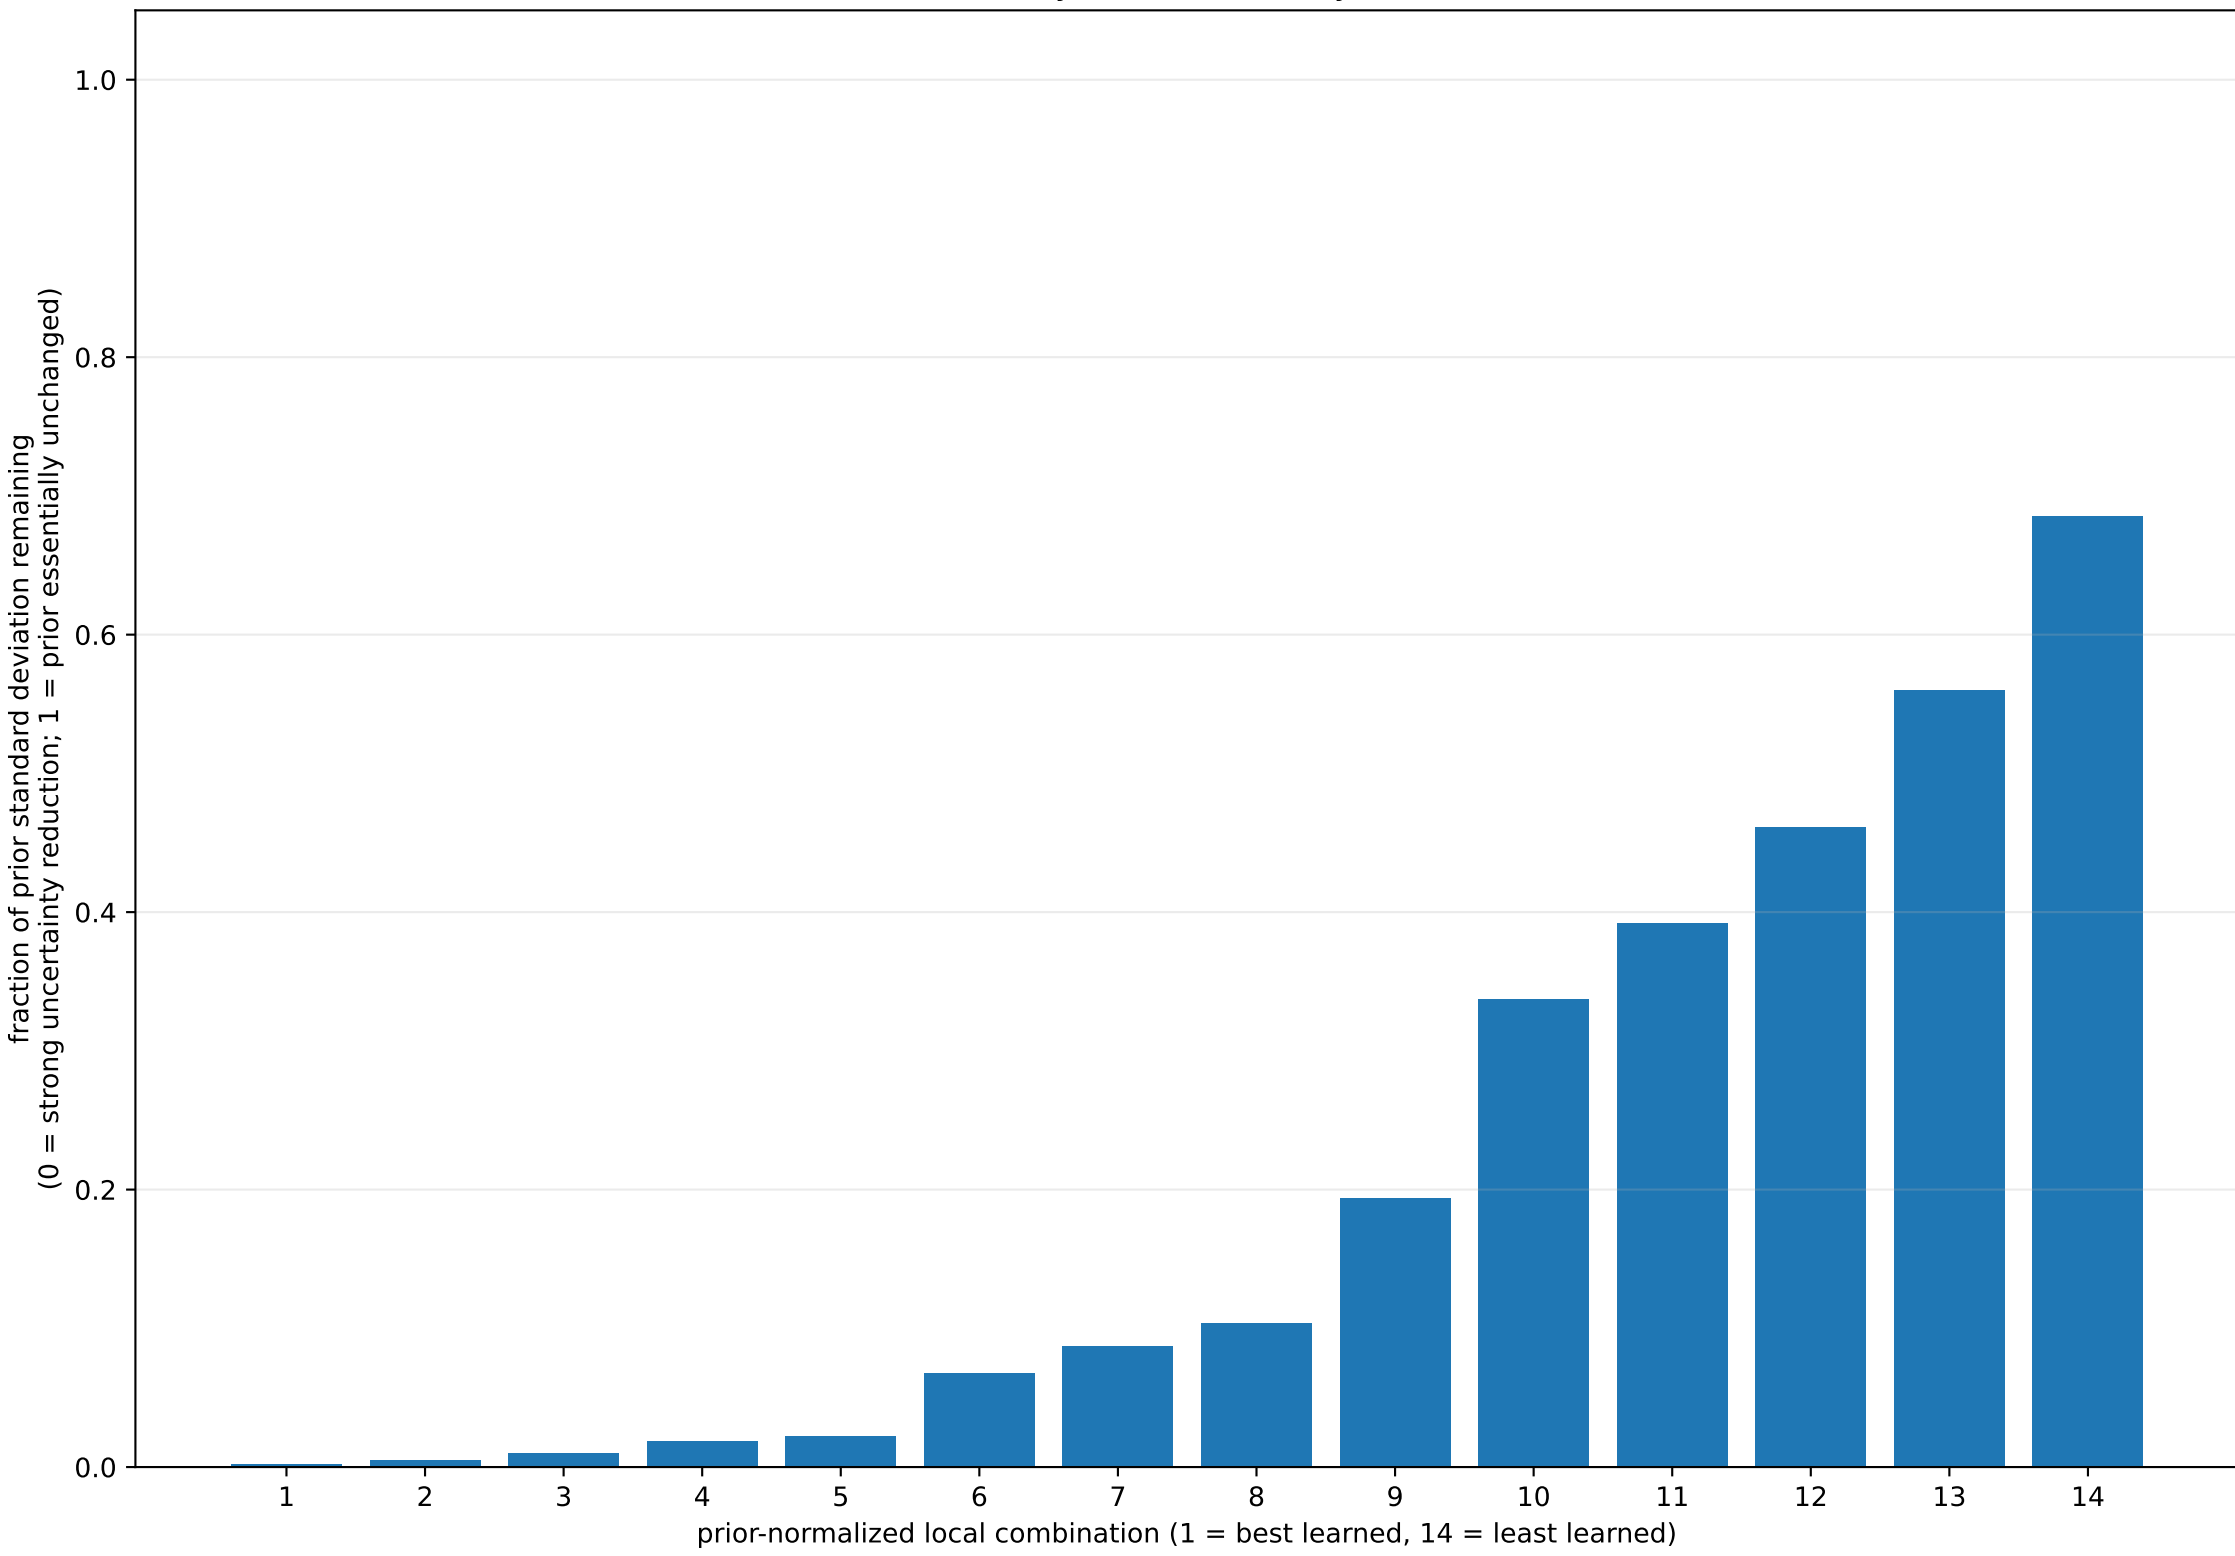

0.2

Axis-wise rotational excitation diagnostic

Low body-z values can support a yaw-excitation hypothesis, but identifiability is decided by the full Jacobian.

How much uncertainty remains in every local combination?

Confidence accumulation as the rosbag becomes longer
