

Fine pose reproduction: position

Fine pose reproduction: roll / pitch / yaw

Fine replay error after the 14-D change — lower is better

Parameter-only open-loop pose: position

Parameter-only open-loop pose: roll / pitch / yaw

Parameter-only open-loop rollout (separate diagnostic)

Dimensionless residual force: empirical mean ± 1 std
Wide band = disturbance varies more, so matching parameter directions receive weaker evidence

Dimensionless residual torque: empirical mean $\pm$ 1 std
Wide band = disturbance varies more, so matching parameter directions receive weaker evidence

Singular values S of the whitened dimensionless Jacobian

Signed right-singular vectors V^T
A complete row may flip sign; relative signs inside the row matter

Decoded physical parameters at the selected estimate

mass [kg]

2.36644918696

inertia J [kg m²]

[0.065002842 1.8488967e-06 1.7461914e-05]

selected delay [s]

0.2

Axis-wise rotational excitation diagnostic

Low body-z values can support a yaw-excitation hypothesis, but identifiability is decided by the full Jacobian.

How much uncertainty remains in every local combination?

Confidence accumulation as the rosbag becomes longer
