

Fine pose reproduction: position

Fine pose reproduction: roll / pitch / yaw

Fine replay error after the 14-D change — lower is better

Parameter-only open-loop pose: position

Parameter-only open-loop pose: roll / pitch / yaw

Parameter-only open-loop rollout (separate diagnostic)

Dimensionless residual force: empirical mean $\pm$ 1 std
Wide band = disturbance varies more, so matching parameter directions receive weaker evidence

Dimensionless residual torque: empirical mean $\pm$ 1 std
Wide band = disturbance varies more, so matching parameter directions receive weaker evidence

Singular values S of the whitened dimensionless Jacobian

Decoded physical parameters at the selected estimate

mass [kg]

2.35159759125

inertia J [kg m²]

[0.065000061 -7.279e-07 1.901508e-05]
[-7.279e-07 0.064952656 5.9167943e-08]
[1.901508e-05 5.9167943e-08 0.12899211]

principal moments [kg m²]

[0.064952645, 0.065000067, 0.12899212]

CoG position in body frame [m]

[-0.0020247086, -3.0526549e-05, 0.0095097496]

rotor force effectiveness

[1, 1, 1, 1]

selected delay [s]

Axis-wise rotational excitation diagnostic

Low body-z values can support a yaw-excitation hypothesis, but identifiability is decided by the full Jacobian.

How much uncertainty remains in every local combination?

Confidence accumulation as the rosbag becomes longer
